Center for International Forestry Research (CIFOR)

CIFOR advances human wellbeing, environmental conservation and equity by conducting research to inform policies and practices that affect forests in developing countries. CIFOR is one of 15 centres within the Consultative Group on International Agricultural Research (CGIAR). CIFOR's headquarters are in Bogor, Indonesia. It also has offices in Asia, Africa and South America.

1. Introduction

The Global Comparative Study on REDD+, established by CIFOR, supports a Forest Carbon Database and exchange system in the public domain. The database helps develop national and subnational monitoring, reporting and verification of REDD+ activities. The database is designed for an open access to allow participation of researchers and practitioners, who carry out regular forest inventory, manage permanent sample plots, and conduct research on forest carbon stocks and related topics.

This system allows you to account for five carbon pools: aboveground tree biomass, belowground tree biomass, dead woody debris, understorey/litter and soil. You can also add supporting information (details on your site, land cover, climate and soil) to build a profile of your carbon stock data. If you upload your entire inventory of data, the carbon stock in that ecosystem will be automatically calculated.

Our system offers the following advantages.

1. We help reduce duplicate data collection by making available data that have already been collected.
This reduces costs.
2. We provide easy access to data that cannot be readily replicated, such as large surveys that are too expensive to replicate.
3. We help you compare carbon stocks across land use types based on data provided by other contributors.

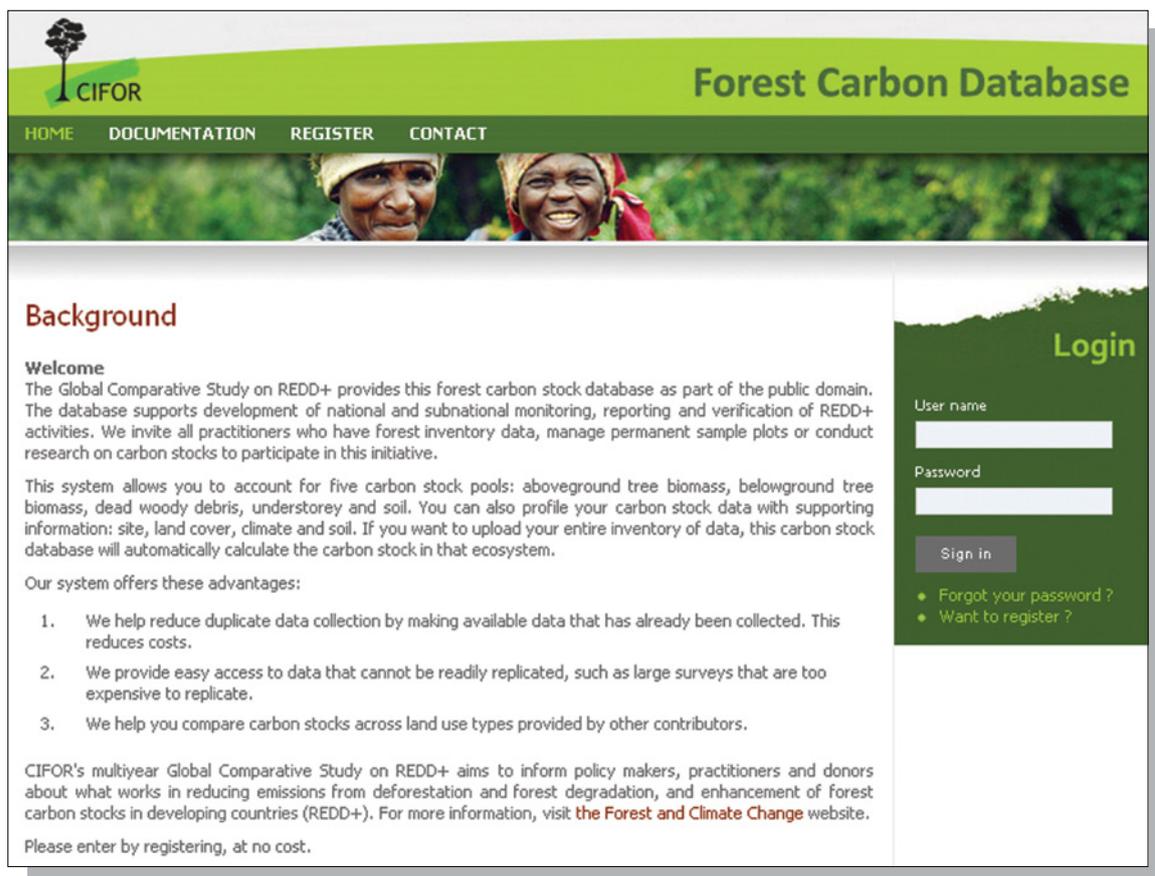

This user guide is designed to familiarise the users with the features of the forest carbon database before deciding to participate and contribute to the system.

2. Getting started

To access the Forest Carbon Database, go to <http://carbonstock.cifor.cgiar.org/> on the Internet. From this home page, anyone can view a table setting out the total carbon stocks in different sites, as provided by contributors. For a more detailed look or to share your own data, you can register as a contributor. This section guides you through the registration process and logging on to the database.

2.1 Registration

1. Select **Want to register?** on the right side of the home page.

The screenshot shows the homepage of the Forest Carbon Database. At the top left is the CIFOR logo, and at the top right is the title "Forest Carbon Database". Below the title is a navigation menu with links for "HOME", "DOCUMENTATION", "REGISTER", and "CONTACT". A banner image shows two smiling women in a forest. The main content area is divided into two columns. The left column has a "Background" section with a "Welcome" message, a description of the database's purpose, a list of three advantages, and a note about the Global Comparative Study on REDD+. The right column features a "Login" section with input fields for "User name" and "Password", a "Sign in" button, and two links: "Forgot your password?" and "Want to register?".

Forest Carbon Database

HOME DOCUMENTATION REGISTER CONTACT

Background

Welcome
The Global Comparative Study on REDD+ provides this forest carbon stock database as part of the public domain. The database supports development of national and subnational monitoring, reporting and verification of REDD+ activities. We invite all practitioners who have forest inventory data, manage permanent sample plots or conduct research on carbon stocks to participate in this initiative.

This system allows you to account for five carbon stock pools: aboveground tree biomass, belowground tree biomass, dead woody debris, understorey and soil. You can also profile your carbon stock data with supporting information: site, land cover, climate and soil. If you want to upload your entire inventory of data, this carbon stock database will automatically calculate the carbon stock in that ecosystem.

Our system offers these advantages:

1. We help reduce duplicate data collection by making available data that has already been collected. This reduces costs.
2. We provide easy access to data that cannot be readily replicated, such as large surveys that are too expensive to replicate.
3. We help you compare carbon stocks across land use types provided by other contributors.

CIFOR's multiyear Global Comparative Study on REDD+ aims to inform policy makers, practitioners and donors about what works in reducing emissions from deforestation and forest degradation, and enhancement of forest carbon stocks in developing countries (REDD+). For more information, visit [the Forest and Climate Change website](#).

Data Exchange Agreement

CIFOR's GCS-REDD Data and Information Exchange Mechanism is a non commercial service with high standards of data management and structuring to maximize sharing of data, ideas, strategies and reporting endowed to governmental/ non-governmental partner organizations, multilateral operations, and interested person. Data access will enable agencies and other related partner organizations to fully participate in this mechanism and benefit from lessons learned of the GCS-REDD.

Accessible Product:

Data exchange mechanism in public domain meant for sustainable development of the national REDD's strategy endowed by CIFOR's GCS-REDD Data and Information Sharing Policy.

Advantages of being a member:

1. To reduce costs by avoiding expensive duplicate data collection efforts by making known what data have been collected so that additional resources are not spent to gather essentially the same information.
2. To provide ready access to data that cannot be readily replicated e.g. large surveys that are too expensive to replicate.

I accept *

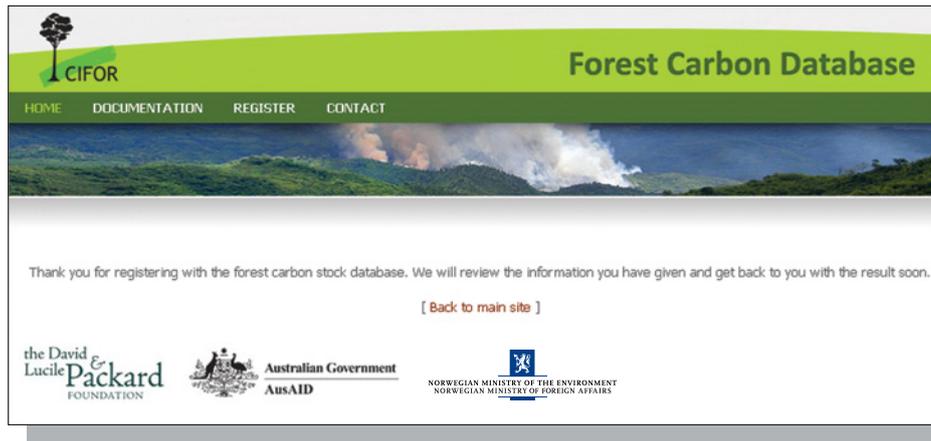

Please type the code shown: *

Try a new code

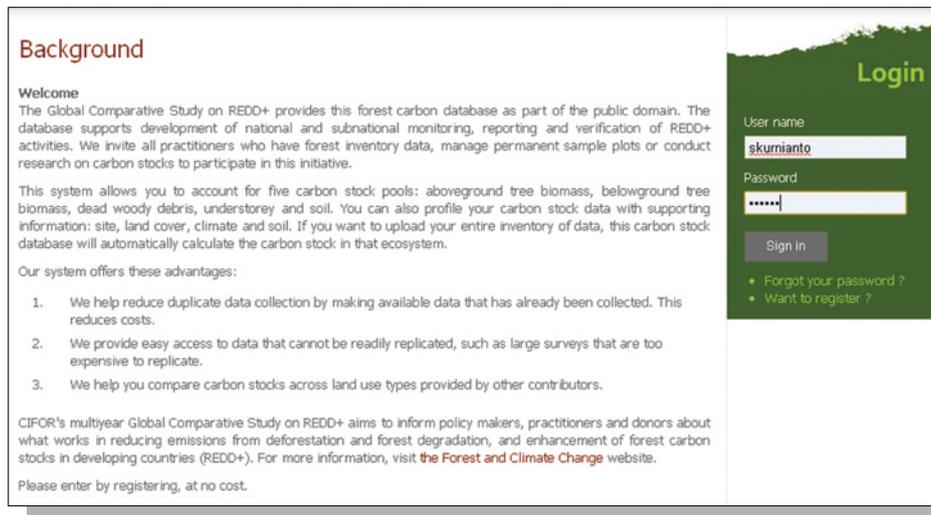

5. The data exchange agreement is given on the **Disclaimer** page. Please read it carefully. If you agree, tick 'I accept'. Type in the code shown, and then click **Send registration** to complete your registration.

When your registration is complete, the following page will appear. We will also send a notification to your email address for verification.

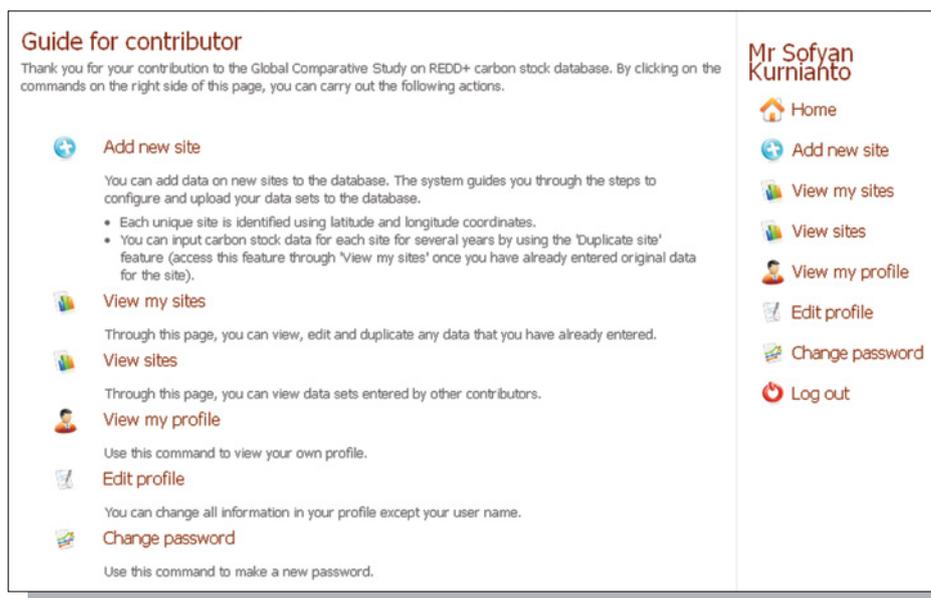

- Once you receive and respond to the email, you can log on to the carbon stock database as a contributor.

2.2 Logging on to the forest carbon database

- To log on, start from the forest carbon database home page at <http://carbonstock.cifor.cgiar.org/>. Enter your user name and password in the boxes on the right of the page and click **Sign in**.

- Your contributor home page will appear. From this page, you will be able to:
 - add new carbon stock data to the database;
 - view data provided by other contributors;
 - view other contributors' profiles; and
 - edit your profile and change your password.

3. Recognising the features of the forest carbon database

3.1 Add new site

Through this section, you can add new carbon stock data for a specific site. In this database, a 'site' represents a landscape with similar land cover type. The following guides you through the process of adding new carbon stock data.

1. Ensure you have already signed in to the forest carbon database system.
2. Click **Add new site** on the right side of the contributor landing page. The input form will appear; it comprises five tabs: Site description, Land cover, Climate, Soil and Total carbon stock. After you complete a tab, click **Next** to move to the next tab. Clicking **Cancel** at any time will terminate the process and you will be returned to your contributor home page.
3. Mandatory site details are location/administrative information, latitude, longitude, altitude and year of the field survey.

Step 1 Site description | Step 2 Land cover | Step 3 Climate | Step 4 Soil | Step 5 Total carbon stock

Site description * required field

Site name *

Village

Subdistrict

District

Province *

Country *

Subregion

Region

Latitude *

Longitude *

Altitude * meters above sea level

Year *

4. Choose the main land cover type in your site: natural forest or plantation. Then, select a more specific type from the dropdown list. You can select only one type of forests. Following are definitions of the options for natural forest land cover types.
 - a. Dry forest: A forest area in which annual precipitation is less than 1500 mm per year or which experiences more than five months of dry season.
 - b. Moist forest: A forest area in which evapotranspiration exceeds rainfall for more than one month but for less than five months. This forest is characterised by a semi-deciduous canopy, and annual precipitation for lowland forests usually ranges between 1500 and 3500 mm.
 - c. Mangrove moist forest: A forest area in a coastal zone or tidal area.

- d. Wet forest: A forest area in which evapotranspiration exceeds rainfall for less than one month, and annual precipitation is greater than 3500 mm.
- e. Primary forest: A forest area comprising native tree species, in which indications of human activity are not clearly visible and ecological processes are not significantly disturbed.
- f. Secondary forest: A forest area regenerating largely through natural processes after significant human disturbance of the original forest vegetation at a single point in time or over an extended period, and displaying a major difference in forest structure and/or canopy species composition with respect to nearby primary forests on similar sites.
- g. Lowland mixed dipterocarp: Forest area dominated by the trees in the family *Dipterocarpaceae*.

In the **Notes** field, you can enter the characteristics of the forest in your site, such as the dominant species, logging activities, presence of a peat swamp, etc.

6. In the **Soil** tab, provide information about the soil texture and soil type. You can choose soil type and texture more than one option. If the relevant type or texture is not provided, select 'Other' and type in the information in the box provided.

Step 1 Site description Step 2 Land cover Step 3 Climate Step 4 Soil Step 5 **Total carbon stock**

Total carbon stock * required field

Above ground

Mean annual increment Mg/ha/year

Wood density g/cm³

Biomass expansion factor

Root-shoot ratio

Key biodiversity concern

7. In the **Total carbon stock** tab, enter the values of mean annual increment, wood density, biomass expansion factor and root-shoot ratio in the appropriate boxes. Describe the general biodiversity condition in your site in the **Key biodiversity concern** box.

8. Next, enter the aboveground biomass of the trees and its carbon concentration in the appropriate box. The default value of carbon concentration is 50%; however, you may change this value if preferred. The carbon stock value will be updated automatically after you input both biomass and carbon concentration.
9. In the woody debris section, you can enter values for fine and coarse woody debris biomass separately and the system will automatically calculate the total woody debris biomass. If your data do not distinguish fine and coarse woody debris, you can enter the woody debris value in the **Total** box.
10. Enter details about the understorey/litter and root biomass and their carbon concentration in the appropriate box.

Living biomass pools

Import and calculate biomass value

Trees *	Biomass (Mg/ha)	Carbon fraction (%)	Carbon stock (Mg C/ha)
Total	<input type="text" value="502.49"/>	<input type="text" value="50"/>	<input type="text" value="251.245"/>

Dead biomass pools

Import and calculate total woody debris value

Woody debris	Biomass (Mg/ha)	Carbon fraction (%)	Carbon stock (Mg C/ha)
Fine woody debris	<input type="text"/>	<input type="text" value="50"/>	<input type="text"/>
Coarse woody debris	<input type="text"/>	<input type="text" value="50"/>	<input type="text"/>
Total	<input type="text" value="25.39"/>	<input type="text" value="50"/>	<input type="text" value="12.695"/>

Upload raw data for understorey and litter

Understorey and litter	Biomass (Mg/ha)	Carbon fraction (%)	Carbon stock (Mg C/ha)
Total	<input type="text" value="21.23"/>	<input type="text" value="50"/>	<input type="text" value="10.615"/>

Below ground

Roots *	Biomass (Mg/ha)	Carbon fraction (%)	Carbon stock (Mg C/ha)
Total	<input type="text" value="99.19"/>	<input type="text" value="50"/>	<input type="text" value="49.595"/>

11. Enter the value of soil organic carbon at the specified soil depth in the appropriate box.

12. The system will calculate the total carbon stock in your site by summing the data you have entered.

Upload raw data for soil

Soil carbon stock Mg C/ha in cm of soil depth

Total carbon stocks Mg C/ha

13. Click **Save** to save your data.

Box 1. Terms used in the Total carbon stock tab

Biomass expansion factor: ratio of oven-dry aboveground biomass to oven-dry inventoried volume biomass.

Litter: all non-living biomass with a diameter less than the minimum diameter chosen by the site country (e.g. 10 cm), lying dead and in various states of decomposition above the mineral or organic soil. This includes the litter, fomic and humic layers. Live fine roots (of less than the standard diameter limit for belowground biomass) are included in litter where they cannot be distinguished from it empirically.

Mean annual increment: the average annual growth that a tree or stand of trees has exhibited for a given period.

Root–shoot ratio: ratio of belowground biomass to aboveground biomass for a specific vegetation type.

Soil organic carbon: includes organic carbon in mineral and organic soils (including peat) to a specified depth chosen by the site country and applied consistently throughout the time series. Live fine roots (of less than the standard diameter limit for belowground biomass) are included with soil organic matter where they cannot be distinguished from it empirically.

Trees: all living biomass including stems, branches, twigs, bark and foliage of trees at breast height (1.37 m) or taller.

Understorey: all living biomass including stems, branches, twigs, bark and foliage for trees shorter than breast height (1.37 m).

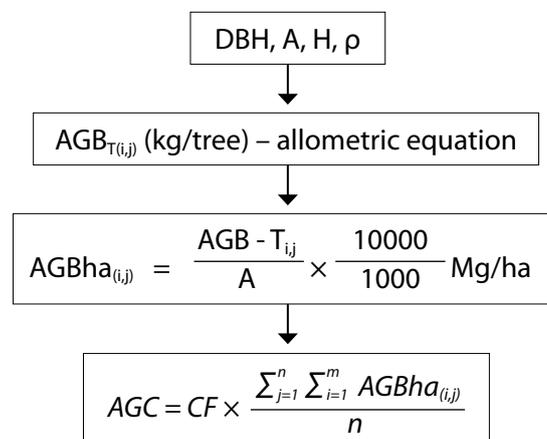

Wood density: the dry mass of wood per unit volume.

Woody debris: all non-living woody biomass not included in litter, whether standing, lying on the ground or in the soil. Dead wood includes wood lying on the surface of the soil, dead roots and stumps at least 10 cm in diameter (or the appropriate diameter used as the standard in the site country).

3.2 Uploading raw data

This section guides you through the process of adding new data to the database by uploading raw tree, wood debris, understorey/litter and soil survey data. The system then calculates the carbon stock for each pool based on the uploaded raw data.

The direct method proposed by IPCC (2003) is used to calculate the above and belowground carbon of trees in this system. This method requires the measurement of the diameter at breast height (1.37 m) of all the trees above the minimum diameter in the surveyed plots, as well as other data such as tree height and wood density. An allometric equation is employed to calculate the aboveground biomass of trees. The equation uses single or combined variables such as diameter, tree height and wood density as independent variables and aboveground biomass of trees as a dependent variable. Belowground biomass is calculated by using the equation of Cairns *et al.* (1997), which includes the relationship between aboveground biomass as an independent variable and belowground biomass as a dependent variable. A list of the allometric equations used in this system is given in Appendix 1. The following is a flowchart of the calculations of the aboveground carbon of trees.

where:

- DBH : diameter at breast height (cm)
- A : plot area (m²)
- H : height of trees (m)
- ρ : wood density (g/cm³)
- AGBT : aboveground biomass of trees (kg/trees)
- AGBha : aboveground biomass of trees per unit area (Mg/ha)
- AGC : aboveground carbon (Mg C/ha)
- CF : carbon fraction (dimensionless; IPCC default is 0.5)
- i : tree number
- j : plot number
- m : number of trees in a plot
- n : number of plots

In this system, woody debris biomass is estimated using the line-intersect survey method. This is a time-efficient method that can be used when the debris quantity is expected to be a relatively small proportion of the total aboveground biomass (IPCC 2003). The diameters of all pieces of wood that intersect the line are measured, and debris is organised into density classes: rotten (fully decomposed) and sound (partially decomposed). The volume per hectare is estimated for each density class as follows (Brown 1974, IPCC 2003):

$$V_{WD} = \frac{(\pi^2 \sum D^2)}{8L}$$

where:

V_{WD} : volume of woody debris per unit area (m^3/ha)

D : diameter of each piece that intersects the line (cm)

L : the length of the line (m)

Finally, the biomass of woody debris is calculated as follows:

$$AGB_{WD} = \rho V_{WD}$$

where:

AGB_{WD} : aboveground biomass of woody debris (Mg/ha)

ρ : wood density of downed woody debris (g/cm^3)

For more information about estimating the biomass of woody debris, see Brown (1974), and Harmon and Sexton (1996).

Understorey and litter can be estimated using a simple harvesting technique (IPCC 2003). This technique uses a small frame (circular or square), usually encompassing an area of $0.5 m^2$, to collect all material inside the frame, including herbaceous plants, grasses, shrub and litter. A well-mixed subsample is collected to determine oven dry-to-wet weight ratios to convert the total wet mass to oven-dry mass.

The soil organic carbon stock is estimated by taking a soil sample in a sample plot. It is recommended that soil samples be taken at several depths. To estimate the soil organic carbon stock, the soil bulk density must be measured at each depth. The concentration of soil organic carbon at a given sample is usually estimated using either dry combustion or the Walkley–Black method. The soil organic carbon stock is estimated as follows:

$$SOC = [SOC] \times BD \times Depth \times 10$$

where:

SOC : soil organic carbon (Mg/ha)

$[SOC]$: the concentration of soil organic carbon in a given soil mass ($g C/kg$ soil sample)

BD : bulk density, the soil mass per sample volume (Mg/m^3)

$Depth$: the depth of the soil sample (m)

The following steps guide you through the process of uploading raw data files.

1. Use Microsoft Excel 2003 to make four files, one each for trees, woody debris, understory/litter and soil inventory data. Note, the system does not accept Excel 2007 (.xlsx) files at this time. Be sure to save your file as ('Save As') a .xls file (Excel 97-2003 Workbook). An Excel template is available for download from http://carbonstock.cifor.cgiar.org/excel_template/. Box 2 shows the information required for each file.

Box 2. Information for uploading raw data

Aboveground living tree inventory

Plot no.	Plot area (m ²)	Species	DBH (cm)	Height (m)	Wood density (g/cm ³)

Woody debris inventory

Plot no.	Transect length (m)	Diameters of pieces (cm)	
		Species	Rotten

Understorey/litter inventory

Plot no.	Plot area (m ²)	Dry litter mass (g)	

Soil samples

Plot no.	Sample depth range (cm)	Depth of sample (cm)	Bulk density (g/cm ³)	Organic matter (%)

Note: All fields in the above four tables are mandatory except Height and Wood density; enter the values for these fields only if the data are available.

- Repeat steps 1–6 in Section 3.1 to input information about your site and its land cover type, climate and soil condition.
- Click **Upload Excel file** for each carbon pool, and select the relevant file from your folders.

Living biomass pools

Import and calculate biomass value [Upload Excel file](#)

Trees *	Biomass (Mg/ha)	Carbon concentration (%)	Carbon density (Mg C/ha)
Total	502.49	50.00	251.25

Dead biomass pools

Import and calculate total woody debris value [Upload Excel file](#)

Woody debris	Biomass (Mg/ha)	Carbon concentration (%)	Carbon density (Mg C/ha)
Fine woody debris		50.00	
Coarse woody debris		50.00	
Total	25.39	50.00	12.70

Upload raw data for understorey and litter [Upload Excel file](#)

Understorey and litter	Biomass (Mg/ha)	Carbon concentration (%)	Carbon density (Mg C/ha)
Total	21.23	50.00	10.62

Below ground

Roots *	Biomass (Mg/ha)	Carbon concentration (%)	Carbon density (Mg C/ha)
Total	99.19	50.00	49.59

- The system will upload the file to the database and calculate the carbon stock.

3.3 Viewing, editing and duplicating your sites

You can view any data you have saved in the database, starting from your contributor home page.

- Click **View my site** on the right side of your contributor home page. This will take you to the **List of my sites** page. On this page, you can sort your data according to the carbon stock, year of measurement, site name, land cover type or country.
- To view more details about a site, select it in the **Site** column.
- To make changes to your data, click **Edit**. When you have finished editing your data, click **Save** on the **Total carbon stock** page to save your changes.

List of my sites

Following is a list of sites for which you have already entered data.

Appendix 1. Allometric equations to estimate the aboveground biomass of trees used in this database

Site	Precipitation	Temperature	Type of forest	Species	Equation for estimating AGBT ^a	References
Pan-tropical	<1500 mm		Dry forest	Mixed	$0.112 (\rho D^2 H)^{0.916}$	Chave <i>et al.</i> (2005)
				Dmax ^b = 63.4 cm	$\rho \exp(-0.667 + 1.784 \ln(D) + 0.207(\ln(D))^2 - 0.0281(\ln(D))^3)$	
	1500–3500 mm		Moist forest	Mixed	$0.0509 \rho D^2 H$	
				Dmax = 138 cm	$\rho \exp(-1.499 + 2.148 \ln(D) + 0.207(\ln(D))^2 - 0.0281(\ln(D))^3)$	
Tropics	>3500 mm; no seasonality		Mangrove moist forest	Mangroves	$0.0509 \rho D^2 H$	
				Dmax = 42 cm	$\rho \exp(-1.349 + 1.98 \ln(D) + 0.207(\ln(D))^2 - 0.0281(\ln(D))^3)$	
				Mixed	$0.0776 (-D^2 H)^{0.94}$	
Tropics			Wet forest	Dmax = 133.2 cm	$\rho \exp(-1.239 + 1.98 \ln(D) + 0.207(\ln(D))^2 - 0.0281(\ln(D))^3)$	Brown (1997)
				Mixed	$21.297 - 6.953(D) + 0.740(D^2)$	
				D ^c = 4–112 cm		
				Mixed	$\exp[-2.289 + 2.649 \cdot \ln(D) - 0.021(\ln(D))^2]$	
Porce Region, Colombia	2078	22.7	Primary forest	Mixed	$2.286 + 2.471 \ln(D)$	Sierra <i>et al.</i> (2007)
				D = 0.5–198 cm		
East Kalimantan, Indonesia	2000	26	Secondary forest	Mixed	$-2.322 + 2.422 \ln(D)$	Basuki <i>et al.</i> (2009)
				D = 0.9–40 cm		
			Lowland mixed dipterocarp	Dipterocarpus	$1.232 + 2.178 \ln(D)$	

a. AGBT : aboveground biomass and trees

b. Dmax : maximum diameter at breast height

c. D : diameter at breast height

Center for International Forestry Research

CIFOR advances human wellbeing, environmental conservation and equity by conducting research to inform policies and practices that affect forests in developing countries. CIFOR is one of 15 centres within the Consultative Group on International Agricultural Research (CGIAR). CIFOR's headquarters are in Bogor, Indonesia. It also has offices in Asia, Africa and South America.
